

Scenario: Site-to-Site VPN

The ADC provide a number of directly connected (Site-to-Site VPN) solutions. The wide-area connectivity can be provided via a Private MPLS network or via the Internet (dependant upon cost and security implications). The ADC provides a ‘closed-circuit’ network between a secure source location and the Customer’s Data Estate. We are able to provide secure remote access for off-site and home user access, if security requirements permit. The ADC employs the latest equipment and technology in order to terminate the VPN circuit and can match any Customer requirements for this connection. The IPSEC Site-To-Site solutions are particularly suited to AM type operations where Customer systems are managed and supported from Capgemini offices; or operations where developers are located within Capgemini locations and the development takes place within remote Customer locations. Current engagements that employ this scenario are RMG, FCA and NHS-24
